

ABSTRACT

A method of installing an application on a target electronic device comprises receiving the application in the target device in unconcentrated form, concentrating the application in the target device, and installing the concentrated application in non-volatile memory of the target device. This method may be performed, for example, by an installer program stored on a medium for storing computer-readable instructions. The installer program, when executed, causes a host device to concentrate an unconcentrated application and install the concentrated application in non-volatile memory of the host device.
